[1] Indicates the dimensions and shape of image, where "⌀ =" stands for diameter and "x=" indicates the nominal image height and width
[2] Working distance: distance between the front end of the mechanics and the object. Set this distance within $\pm 3\%$ of the nominal value for maximum resolution and minimum distortion.
[3] working f/N: the real f/N of a lens in operating conditions.
[4] Maximum angle between chief rays and optical axis on the object side calculated at 588nm
[5] Percent deviation of the real image compared to an ideal, undistorted image: typical (average production) values and maximum (guaranteed) values are listed.
[6] At the borders of the field depth the image can be still used for measurement but, to get a very sharp image, only half of the nominal field depth should be considered. Pixel size used for calculation is 3.45 µm.
[7] Object side, calculated with the Rayleigh criterion with λ= 520 nm
[8] Used in continuous (not pulsed) mode.
[9] At max forward current. Tolerance is ±0.06V on forward voltage measurements.
[10] At pulse width <= 10 ms, duty cycle <= 10% condition. Built-in electronics board must be bypassed (see tech info).
[11] Measured from the camera flange of the objective lens to the electronic end of the illuminator. Cable, connector and mount thread excluded
